**Peter A. McCullough, MD, MPH | substack.com/@petermccullloughmd**

## 31 Million Americans Still Getting Boosted

The interview opens with a sobering statistic: **31 million Americans — 8.9% of the population — continue taking COVID boosters**, according to McCullough's calculations published on his *Focal Point* Substack. That's despite years of mounting evidence that the mRNA shots cause **myopericarditis** in healthy young people, particularly young men.

McCullough explains the mechanism plainly: small areas of inflammation and scarring in the heart that serve as triggers for lethal arrhythmias. This is the pathology behind the widely observed phenomenon of young men collapsing on soccer fields, at gyms, and walking through their neighborhoods. The acute danger has receded simply because fewer people are getting jabbed, but for those still lining up, the risk remains.

## Ron Johnson's Push: Make Vaccine Injury a Real Diagnosis

John Solomon reported that **Senator Ron Johnson** appeared on the news exposing the government concealment of vaccine injuries. Johnson had a concrete proposal: the U.S. government should mandate that **COVID-19 vaccine injury be recognized as a legitimate medical condition**, complete with ICD-10 diagnostic codes and insurance reimbursement.

Sen. Ron Johnson Talks Alleged COVID Cover-Up

McCullough agrees without hesitation. He estimates that **between 5% and 15% of Americans** are carrying some form of vaccine injury or a worsening of a baseline medical condition triggered by vaccination. These people are seeking care and paying out of pocket. McCullough argues the medical establishment needs formal codes, reimbursement structures, and a willingness to "come into the fold and treat people as they should."

## Ivermectin-Fenbendazole: 84% Response Rate — and the NCI Won't Touch It

Head asks about progress on ivermectin and fenbendazole for cancer. McCullough points to a **recent JAMA report by Rockwell and colleagues** documenting that use of this drug combination in cancer patients has **skyrocketed during 2025**. The catalyst? **Mel Gibson's appearance on Joe Rogan's podcast**, where he discussed these therapies openly.

# Ivermectin-Benzimidazole Prescribing Following Celebrity Endorsement

Michelle S. Rockwell, PhD; Katherine L. Kahn, MD; A. Mark Fendrick, MD; Sitaram Vangala, MS; John N. Mafi, MD, MPH

## Results

Within the cohort of 68 373 949 patients, overall ivermectin-benzimidazole prescribing rates doubled from January 1, 2025, to July 31, 2025, compared with January 1, 2024, to July 31, 2024 (RR = 1.97; 99.5% CI, 1.70-2.29) (**Figure**). Relative increases in ivermectin-benzimidazole prescribing were higher in patients ages 18 to 64 years compared with those 65 years or older (RR = 2.12 [99.5% CI, 2.36-2.99] vs RR = 1.25 [99.5% CI, 0.91-1.59]), White patients compared with other racial groups

Vertical dotted line represents celebrity endorsement of ivermectin-benzimidazole treatment for cancer in January 2025.

The Wellness Company's micronized ivermectin-fenbendazole formula has now produced the **first clinical report showing roughly an 84% positive impact** — meaning cancer either stabilized or improved when the combination was added to standard oncology care. McCullough calls on the **National Cancer Institute**, which he says is clearly tracking the Rockwell data, to step up and fund a large prospective randomized double-blind placebo-controlled trial. They haven't. The NCI knows, he implies — and they're choosing inaction.

## "Turbo Cancer" and the 2021 Inflection Point

The most ominous part of the interview concerns what McCullough calls **"turbo cancer."** He notes that *Time Magazine* ran a 2025 cover story asking where all the

cancer in young people was coming from. The answer, McCullough says, is visible in the data: after two decades of gradually rising cancer rates, **2021 marked a sharp inflection upward** — the same year mass COVID vaccination rolled out.

Imtiaz, diagnosed with colon cancer at 26
Carrie, diagnosed with ovarian cancer at 40

A recent Senate hearing examined the link between COVID-19 vaccination — particularly Pfizer and Moderna — and future cancer development. While the acute cardiovascular and thrombotic risks have diminished as fewer people take the shots, McCullough warns a wave of vaccine-associated cancers may just be beginning. He says the term “turbo cancer” fits what practitioners are seeing in clinic: aggressive, fast-moving malignancies in young patients with no family history.

## New World Screwworm: A Flesh-Eating Threat at the Border

The conversation takes an unexpected turn to the **New World Screwworm**, recently found infecting a dog. McCullough explains the screwworm is actually **fly larvae** — aggressive, large worms that invade living tissue. He’s less worried about pets than about his diabetic patients in Texas: a fly landing on a diabetic ulcer and depositing eggs could create a nightmare scenario.

**Ivermectin, recently FDA EUA over-the-counter in cattle, kills the eggs if administered early**, but if the infestation goes undetected, the worms grow so large they must be extracted surgically. McCullough notes that years ago, authorities released sterilized flies near the border to neutralize the screwworm population — a strategy that may need repeating.

demonstrated in Florida from 1935 to 1938, when the U.S. Bureau of Entomology and Plant Quarantine, in cooperation with the southeastern states, conducted a screwworm education and control program. Using benzol and pine tar oil to treat infested wounds, screwworm infestations were reduced within one and a half years to such a low level that there were no losses of livestock. Novy reports the program could not be sustained and NWS could not be eradicated because wildlife and non-attended domestic animals served as reservoirs.

# FDA Issues Emergency Use Authorization for Over-the-Counter Injectable Drug to Prevent New World Screwworm in Cattle

February 5, 2026

Today the U.S. Food and Drug Administration issued an Emergency Use Authorization (EUA) for Ivomec (ivermectin) injectable solution against New World screwworm (NWS). The agency has concluded that based on the scientific evidence available, it is reasonable to believe that Ivomec may be effective for the prevention of infestations caused by NWS larvae (myiasis) in cattle when administered within 24 hours of birth, at the time of castration, or when a wound appears, and the known and potential benefits of the product outweigh its known and potential risks.

Ivomec is not for use in female dairy cattle producing milk for human consumption and calves that will be processed for veal. The slaughter withdrawal period for cattle is 35 days.

This EUA will be effective until it is revoked or the HHS Secretary terminates the declaration that the potential public health emergency presented by NWS justifies the emergency use authorization of animal drugs for NWS.

Ivomec is available over the counter without a prescription. Producers are responsible for using Ivomec in accordance with the product labeling and fact sheet. To reduce the risk of antiparasitic resistance and preserve drug effectiveness against both NWS and other parasites, producers are encouraged to use antiparasitic drugs like Ivomec only when medically necessary and as part of a comprehensive parasite management strategy.

The FDA has previously approved Ivomec to treat and control other parasites in cattle, swine, reindeer and American bison.

Ivomec is sponsored by Boehringer Ingelheim Animal Health USA, Inc. based in Duluth, Georgia.

## Ebola: Sanitation Problem, Not Pandemic Threat

McCullough dismisses concerns about the Ebola outbreak in the Democratic Republic of Congo and Uganda going pandemic. He calls it a **straightforward sanitation crisis**: less than 1% of people in affected areas can wash their hands after using the bathroom. The WHO, he says, should focus on sanitation infrastructure and education about burial procedures that don’t spread the virus.

He offers a striking statistic: there have been **no reported ICU deaths** from this outbreak. Fatalities have occurred in the bush among people with no access to proper supportive care. Those who reach treatment survive. The real story isn't a scary virus — it's the absence of basic healthcare. Yet Politico has been serving up Ebola fear stories in time for the World Cup and a fast-tracked vaccine for this summer.

LOS ANGELES — When the United States, Canada and Mexico formally submitted their co-hosting bid to soccer governing body FIFA in 2018, they touted the safety of the region, noting "no major endemic infectious diseases across any of our Host Countries."

Now, as the three countries prepare to welcome one of the largest international gatherings around the globe since the Covid-19 pandemic, infectious diseases are front of mind.
